Introduction

The Things We Never See

We tend to notice the value of things only once they begin to disappear.

We're content with a clean house until the dust starts to thicken. We appreciate clear air only once the sky turns hazy with smog. We recognize the importance of water only when the tap starts running dry.

AI is no different. All we see is a screen — an answer bouncing back in a fraction of a second. But behind every sentence of that answer lies a hidden chain of resources.

Token → Processing → Electricity → Cooling → Water →
Cost

We never see the data center. We never see the machines spinning. We have no idea how much energy a single question costs. It's like turning on the tap at home — we only

see the water flow, never the pipes, the pumping stations, or the source it all comes from.

This book isn't here to teach you programming. It's an invitation to look at what's hidden behind the curtain, and to sit with one simple question: if resources are finite, how should we use AI to get the most out of them?

Part

01

**Someone Who Didn't Come from the IT
World**

Chapter 1

01

I'm Not a Programmer

I didn't grow up with a keyboard in my hands. I never learned to code as a kid. My foundation was built on hands and physical reality — art, sculpture, carving patterns into raw material, working construction sites, touching concrete, stone, steel, managing people, overseeing work you have to see with your own eyes and hold in your own hands. For more than twenty years.

Then, one day, I found myself slowly stepping into a world I didn't recognize.

AI → Code → Application → Digital World

At first, it felt cryptic — like standing in front of a door with no idea how to open it. Sometimes I understood. Sometimes I was completely lost. Sometimes I trial-and-errored my way to the edge of giving up entirely.

The turning point was discovering that AI isn't only for people who are good with computers. It opens a path for someone with no team of programmers, no big-company budget, to take an idea in their head and give it shape. A person who has worked with their hands their whole life can use their mind and this new tool to build on their own ideas too.

You don't have to be the best. You just have to learn one step at a time, and use it in the right place. This was the starting point of a journey that changed how I see things — for good.

Part

02

The Day AI Wasn't as Free as I Thought

Chapter 2

02

Even the Best AI Has a Price

In the early days of using AI, it felt like getting something for free. Type a question, get an answer. There seemed to be no cost at all.

What brought this into focus was when the government launched the AIPass project, opening access to more than 30 AI models to try — many I'd never even heard of. Testing them side by side, I realized that not every AI model is gold, and not every model fits every job. Some excel at descriptive writing. Some are built for deep analysis and complex calculation. Some are suited to generating images. Some are compact and fast, good for light work. Some are large and heavyweight, demanding serious power.

What often gets overlooked is the hidden cost. Using a top-tier model might give you a flawless answer, but behind it sits an enormous draw on resources. The credits you're given don't refill endlessly — use them carelessly and they run out

fast. On a small task you might not even notice. But once you start a real, sustained project, the cost slowly surfaces, like an iceberg hidden beneath the waterline.

This is exactly where "Less Is More" starts to mean something in practice. Not just a nice phrase — but a matter of survival and efficiency.

Chapter 3

03

Why Use the Expensive AI for Everything?

Once the cost becomes visible, an important question follows: how necessary is it, really, to use the most expensive, most impressive tool for every single task?

Think of a carpenter. He has a saw, a hammer, a hand plane. He doesn't need to reach for an expensive power saw just to trim a small line or smooth a surface. He picks the tool that fits the job — heavy machinery for rough work, hands and small tools for the fine details.

AI works the same way. For summarizing text or taking in basic information, a mid-sized or free model is already enough. Save the large, heavyweight models for work that demands deep logical reasoning or high-level creativity.

Using more than you need doesn't just waste resources and money — it slows the system down, wastes time, and stunts the very thinking skills you should be training. Real

intelligence in using AI isn't about reaching for the most expensive option. It's about using the right tool, in the right place, for the best return.

Part

03

Less Is More

Chapter 4

04

Credit Is Limited, Thought Is Not

Once I understood that credits and resources aren't infinite, my perspective shifted. The question changed from "What can AI do for me?" to "How do I get the most out of what little I have?"

I began experimenting with assigning work to different AI models according to their strengths, dividing it into three tiers.

The first tier is a free AI outside of AIPass, whose job is to gather up scattered thoughts, sketch a rough outline, and summarize the general concept of a project.

The second tier is Claude Sonnet, which I've used for a long time and which understands my context and my way of working well, from countless conversations together. I have Sonnet summarize everything about the project, then

compose it into a prompt phrased in a way the next AI will understand fastest. Simply put, it's like having Sonnet write the letter for me, before I send it on to Opus.

The third tier is Claude Opus, whose credits I save exclusively for work that's genuinely hard and important. When the code or the answer comes back, I fold it into my notes and send it back to Sonnet to summarize and prepare the next step. This cycle repeats, round after round, until a project gradually takes shape across dozens of files.

This isn't just about saving money — it trains discipline in how you think. A limit isn't a wall; it's a force that pushes you to think more cleverly. Fewer resources doesn't mean a smaller result. Sometimes it's exactly what pushes you to build something sharper and more effective than before.

Chapter 5

05

When We Discover That Words Have a Cost Too

We humans like to talk in circles, drag out a story, explain the same thing twice. Sometimes we use a hundred words when the real point is just one. We can get away with this because the human brain fills in context on its own. Going around the houses, or dressing things up with flowery words, has never really cost us anything.

But for AI, every word, every sentence, is a processing burden. The longer and more rambling the input, the more resources it consumes. Which raises a question: what happens if we keep the full essence of the meaning intact, but cut away everything extra?

Cutting words down here doesn't mean cutting meaning down. It means cutting the excess — keeping only what's essential, and communicating exactly to the point. This is what led me to build a tool called EPOS.

Part

04

The Birth of EPOS

Chapter 6

06

A Language Between Human and AI

EPOS isn't a research paper out of a lab. It wasn't born inside some tech giant with a huge team and a massive budget. Its origin is an ordinary problem faced by one ordinary user: AI credit is limited, long prompts burn through cost, and communication still wasn't landing as precisely as it should.

I pictured it simply: say a task takes 100 tokens. If we could convey the "necessary meaning and instruction" in a way AI understands using just 40 tokens, that's roughly a 60% cut in what needs processing. That number isn't fixed — different kinds of work compress by different amounts. Some tasks should only be trimmed lightly, because the details matter to the outcome. But the principle stays the same: keep every necessary meaning intact, and cut only what isn't needed.

From this idea, I built a real, working application called **NUTEAM EPOS OPTIMIZER**. Put simply, it's a translator — turning human language into the most compact form AI can

interpret. It travels from

Natural language (roundabout, padded, long-winded) →
Structured meaning (clear, ordered, complete) → Delivered
to AI: fast to understand, light to process

Its heart isn't indiscriminate word-cutting. It's the
elimination of the unnecessary, while keeping the entire core
of meaning fully intact.

Chapter 7

07

Less Doesn't Mean Losing Meaning

The biggest risk of compressing information is that it gets shorter but also flatter. Cut too much, and the structure collapses, the context disappears, the meaning warps. What you're left with is a short sentence with nothing inside it — which is entirely useless.

So EPOS isn't just a generic text-compression program. It's meaning compression. There are five things it protects without compromise: the clear task and goal, the context and scope of the work, the special requirements and constraints, the ultimate objective, and the desired output format.

As for padded explanations, repeated words, or preambles that don't help AI understand the task any better — these are the excess weight that never needed carrying in the first place.

Chapter 8

08

From Saving Credit to a Bigger Question

When I first conceived this system, the purpose was small — I just wanted to save my own credits.

Look at it in terms of real credit. Say your existing credit lets you complete ten tasks with a top-tier AI. If cutting tokens and organizing your workflow reduces the average cost per task by around 30%, your theoretical capacity might shift from ten tasks to about thirteen. That doesn't mean EPOS conjures credit out of nowhere — it means the same credit can do more work. Scale it to a hundred tasks, and it might shift to around a hundred and thirty. All of this is a mathematical illustration to show the idea, not a guaranteed number for every project.

But looking deeper into the mechanism behind it, a bigger picture slowly emerges. A token isn't just a number on an account balance. It's a symbol standing in for a real, costly chain of resources.

Token → Processing → Electricity → Cooling → Water →
Physical Cost

Cutting one token doesn't translate to exactly one liter of water saved. But the more important question is the principle: if the system doesn't need to process something meaningless, why send it at all? Cutting the excess is no longer just about you anymore — it's a responsibility toward the shared resources everyone using AI is drawing on right now.

Part

05

The Things Humans Don't See

Chapter 9

09

We Only See What's Right in Front of Us

Using AI is like standing at a doorway and only ever seeing what's on your side of it. We see the answer appear on the screen, fast and convenient. But hidden behind it is a massive data center, rows of machines stretching into the hundreds and thousands, servers running so hard they run hot, huge cooling systems, cables, air ducts, water pipes, and an enormous flow of electricity circulating nonstop. It's exactly like turning on the tap at home and never once seeing the water treatment plant, far away, that makes it possible.

What we can't see, we tend to overlook — and assume it will never run out.

Chapter 10

10

Until It Starts to Run Out

Humans have one strange habit: we rarely see the value of something until it starts disappearing. When there's plenty, we use it carelessly, unconcerned with our own words. It's only once scarcity sets in that we start thinking about value at all.

It's the same with AI credit. Scarcity is what teaches us to think, to conserve, and to recognize the value of everything we once had without ever noticing it.

Part

06

**AI Is More Than a Question-Answering
Machine**

Chapter 11

11

What AI Can Really Do for Us

Most people see AI as nothing more than a question-answering machine — type a question, get an answer, done. But the truth runs much deeper than that. It's like buying a desk and only ever using one leg of it.

People already have thoughts in their heads — ideas, problems, imagination. What's usually missing is method. Not knowing where to start, how to sequence things, how to explain clearly, how to weave separate threads into an actionable plan.

This is exactly where AI steps in — like a workbench for your thinking. It takes the messy, scattered thoughts you spread across the table and gradually helps sort them into steps.

**Problem → Core Idea → Reasoning → Goal → Structure →
Plan → Action**

AI doesn't think for us. It helps us see our own thinking more clearly — clearly enough to grasp, and to build on.

Chapter 12

12

AI Doesn't Always Think for Us

A common misunderstanding is treating AI as something that thinks in your place, that you can order to do everything. The question you should really be asking yourself every time is a simple one: what do I already have in my head, and how can AI help polish it until it shines?

AI isn't the judge of right and wrong. It isn't your boss, and it isn't a brain separate from your own. It's a polishing tool — one that expands the thinking you already have into something clearer and more complete. Feed it a vague idea, and you'll get a vague result back. But if you hold a solid core and use AI as your organizing assistant, you'll see your own ability from an angle you never knew existed.

Part

07

AI for Ordinary People

Chapter 13

13

You Don't Need a Team to Build Something

In the old days, turning an idea into reality required a full team across every discipline — designers to draw, programmers to code, writers to craft the words, analysts to plan, marketers to get the work out into the world. So countless people had great ideas filling their heads, but no resources and no one to help — and had to let those ideas sink back down, unrealized.

AI has completely rewritten that equation. Today, a single person can access a wide range of capabilities through a single machine — not because that person suddenly became an expert in everything, but because a powerful tool now stands behind them, ready to support. The door of opportunity has swung open wider, no longer reserved for big companies or the well-connected.

Chapter 14

14

Grassroots People Have Ideas Too

Technology isn't a privilege reserved for city dwellers or IT people. Market vendors, craftspeople, artists, rural teachers, farmers, small shop owners, every kind of freelancer — all of them carry their own particular problems, their own creative thinking, their own goals.

What they usually lack isn't ability or ideas — it's an accessible tool, basic knowledge, and help organizing their thinking. AI steps in to fill exactly that gap: a thinking partner, a tool that helps get things done, a patient advisor, regardless of anyone's background.

Chapter 15

15

When an Idea Travels Farther Than One Person Ever Could

This is the deepest change of all. AI doesn't automatically make us smarter — it expands the reach of our thinking. What was once just a vague image in someone's head can now travel much farther: into a clear concept, a structure, a plan, a prototype, a real product, actual work, or even a book — like the one you're reading right now.

A human idea no longer has to die with the person who thought it. It has the chance to grow, spread, and keep on creating value. Resources may be finite — but the power of an idea, once given the right tool, is nearly boundless.

Afterword

Less Is More

In the end, EPOS's value may have nothing to do with how many tokens it manages to cut. AI itself isn't important merely because it answers fast. And technology isn't great simply because it's large.

The real question is far simpler than that: have we made the most of what we already have? Limited credit, the hours in a day, energy, water, every kind of resource, including our own thinking — all of it shares one thing in common. It has value precisely because it isn't infinite.

01

"Less Is More" isn't just a token-saving technique. It's a way of thinking, and a way of working.

02

Use fewer resources, but create more understanding and more value.

03

Speak and instruct less, but communicate more clearly, more precisely, more deeply.

04

Use less energy and less cost, but create value that is more lasting and more meaningful.

05

Perhaps the best AI isn't the one that does everything for us. It's the one that unlocks our potential — helping us make what's already in our own heads as real as it can possibly be.
